8	Colofon	37

1 Introduction

In ConT_EXt MkII there is a module that implements consistent typesetting of units (quantities and dimensions). In MkIV this functionality is now part of the physics core modules. This is also one of the mechanisms that got a new user interface: instead of using commands we now parse text. Thanks to those users who provided input we're more complete now than in MkII. You can browse the mailing list archive to get some sense of history.

2 The main command

The core command is `\unit`. The argument to this command gets parsed and converted into a properly typeset dimension. Normally there will be a quantity in front.

```
10 meter           10 m
10 meter per second 10 m/s
10 square meter per second 10 m2/s
```

The parser knows about special cases, like synonyms:

```
10 degree celsius  10 °C
10 degrees celsius 10 °C
10 celsius          10 °C
```

The units can be rather complex, for example:

```
\unit{30 kilo pascal square meter / second kelvin}
```

This comes out as: 30 kPa·m²/s·K. Depending on the unit at hand, recognition is quite flexible. The following variants all work out ok.

```
10 kilogram  10 kg
10 kilo gram 10 kg
10 k gram    10 kg
10 kilo g    10 kg
10 k g       10 kg
10 kg        10 kg
10 kilog     10 kg
10 kgram     10 kg
```

Of course being consistent makes sense, so normally you will use a consistent mix of short or long keywords.

You can provide a qualifier that gets lowered and appended to the preceding unit.

```
\unit{112 decibel (A)}
```

This gives: 112 dB_A. Combinations are also possible:

5 watt per meter celsius	5 W/m·°C
5 watt per meter degrees celsius	5 W/m·°C
5 watt per meter kelvin	5 W/m·K
5 watt per meter per kelvin	5 W/m/K
10 arcminute	10′
10 arcminute 20 arcsecond	10′ 20″

3 Extra units

To some extent units can be tuned. You can for instance influence the spacing between a number and a unit:

```
\unit{35 kilogram per cubic meter}
\setupunit[space=normal] \unit{35 kilogram per cubic meter}
\setupunit[space=big]    \unit{35 kilogram per cubic meter}
\setupunit[space=medium] \unit{35 kilogram per cubic meter}
\setupunit[space=small]  \unit{35 kilogram per cubic meter}
\setupunit[space=none]   \unit{35 kilogram per cubic meter}
```

Of course no spacing looks rather bad:

```
35 kg/m³
35 kg/m³
35 kg/m³
35 kg/m³
35 kg/m³
35kg/m³
```

Another parameter is `separator`. In order to demonstrate this we define an extra unit command:

```
\defineunit[sunit][separator=small]
\defineunit[nunit][separator=none]
```

We now have two more commands:

```
\unit {35 kilogram cubic meter}
\sunit{35 kilogram cubic meter}
\nunit{35 kilogram cubic meter}
```

These three commands give different results:

```
35 kg·m³
35 kg m³
```

35 kgm³

Valid separators are `normal`, `big`, `medium`, `small`, `none`. You can let units stand out by applying color or a specific style.

```
\setupunit[style=\bi,color=maincolor]
\unit{10 square meter per second}
```

Keep in mind that all defined units inherit from their parent definition unless they are set up themselves.

10 m²/s

To some extent you can control rendering in text and math mode. As an example we define an extra instance.

```
\defineunit[textunit][alternative=text]

test \unit {10 cubic meter per second} test
test \textunit{10 cubic meter per second} test
test $\unit {10 cubic meter per second}$ test
test $\textunit{10 cubic meter per second}$ test
test 10 \unit {cubic meter per second} test
test 10 \textunit{cubic meter per second} test
test $10 \unit {cubic meter per second}$ test
test $10 \textunit{cubic meter per second}$ test
```

```
test 10 m3/s test
test 10 m3/s test
test 10 m3/s test
test 10 m3/s test
test 10 m3/s test
test 10 m3/s test
test 10m3/s test
test 10m3/s test
```

4 Labels

The units, prefixes and operators are typeset using the label mechanism which means that they can be made to adapt to a language and/or adapted. Instead of language specific labels you can also introduce mappings that don't relate to a language at all. As an example we define some bogus mapping.

```
\setupunittext
  [whatever]
  [meter=retem,
   second=dnoces]

\setupprefixtext
  [whatever]
  [kilo=olik]

\setupoperatortext
```

```
[whatever]
[solidus={ rep }]
```

Such a mapping can be partial and the current language will be the default fallback and itself falls back on the English language mapping.

```
\unit{10 km/s}
\unit{10 Kilo Meter/s}
\unit{10 kilo Meter/s}
\unit{10 Kilo m/s}
\unit{10 k Meter/s}
```

When we typeset this we get the normal rendering:

```
10 km/s
10 km/s
10 km/s
10 km/s
10 km/s
```

However, when we change the language parameter, we get a different result:

```
10 olikretem rep dnoces
10 olikretem rep dnoces
10 olikretem rep dnoces
10 olikretem rep dnoces
10 olikretem rep dnoces
```

The alternative rendering is set up as follows:

```
\setupunit[language=whatever]
```

You can also decide to use a special instance of units:

```
\defineunit[wunit][language=whatever]
```

This will define the `\wunit` command and leave the original `\unit` command untouched.

5 Digits

In addition to units we have digits. These can be used independently but the same functionality is also integrated in the unit commands. The main purpose of this command is formatting in tables, of which we give an example below.

```
12,345.67 kilogram 12,345.67 kg
__,_1.23 kilogram   1.23 kg
__,_.12 kilogram    .12 kg
__,_1.== kilogram   1    kg
__,__:23 kilogram   23 kg
```

The `_` character serves as placeholders. There are some assumptions to how numbers are constructed. In principle the input assumes a comma to separate thousands and a period to separate the fraction.

10 km/s 10 km/s 10 km/s 10 km/s 10 km/s

You can swap periods and commas in the output. In fact there are a few methods available. For instance we can separate the thousands with a small space instead of a symbol.

```
\starttabulate[|c|r|r|]
\HL
\NC 0 \NC \setupunit[method=0]\unit{00,000.10 kilogram}
      \NC \setupunit[method=0]\unit{@@,@@0.10 kilogram} \NC \NR
\NC 1 \NC \setupunit[method=1]\unit{00,000.10 kilogram}
      \NC \setupunit[method=1]\unit{@@,@@0.10 kilogram} \NC \NR
\NC 2 \NC \setupunit[method=2]\unit{00,000.10 kilogram}
      \NC \setupunit[method=2]\unit{@@,@@0.10 kilogram} \NC \NR
\NC 3 \NC \setupunit[method=3]\unit{00,000.10 kilogram}
      \NC \setupunit[method=3]\unit{@@,@@0.10 kilogram} \NC \NR
\NC 4 \NC \setupunit[method=4]\unit{00,000.10 kilogram}
      \NC \setupunit[method=4]\unit{@@,@@0.10 kilogram} \NC \NR
\NC 5 \NC \setupunit[method=5]\unit{00,000.10 kilogram}
      \NC \setupunit[method=5]\unit{@@,@@0.10 kilogram} \NC \NR
\NC 6 \NC \setupunit[method=6]\unit{00,000.10 kilogram}
      \NC \setupunit[method=6]\unit{@@,@@0.10 kilogram} \NC \NR
\HL
\stoptabulate
```

0	00,000.10 kg	0.10 kg
1	00.000,10 kg	0,10 kg
2	00,000.10 kg	0.10 kg
3	00 000,10 kg	0,10 kg
4	00 000.10 kg	0.10 kg
5	00 000,10 kg	0,10 kg
6	00 000.10 kg	0.10 kg

The digit modes can be summarized as::

1. periods/comma
2. commas/period
3. thinmuskip/comma
4. thinmuskip/period
5. thickmuskip/comma
6. thickmuskip/period

You can reverse the order of commas and period in the input by setting the parameter `order` to `reverse`.

The digit parser handles a bunch of special characters as well as different formats. We strongly suggest you to use the grouped call.

- . , . comma or period
- , , . comma or period
- : invisible period
- ; invisible comma
- _ invisible space

/ invisible sign
 - - minus sign
 + + plus sign
 // invisible high sign
 - - high minus sign
 ++ + high plus sign
 = - zero padding

Let's give some examples:

1	1
12	12
12.34	12.34
123,456	123,456
123,456.78	123,456.78
12,34	12,34
.1234	.1234
1234	1234
123,456.78^9	123,456.78×10 ⁹
123,456.78e9	123,456.78×10 ⁹
/123,456.78e-9	123,456.78×10 ⁻⁹
-123,456.78e-9	-123,456.78×10 ⁻⁹
+123,456.78e-9	+123,456.78×10 ⁻⁹
//123,456.78e-9	123,456.78×10 ⁻⁹
--123,456.78e-9	-123,456.78×10 ⁻⁹
++123,456.78e-9	+123,456.78×10 ⁻⁹
__, __, 123,456,789.00	123,456,789.00
__, __, _12,345,678.==	12,345,678

6 Adding units

It is possible to add extra snippets. This is a two step process: first some snippet is defined, next a proper label is set up. In the next example we define a couple of T_EX dimensions:

```

\registerunit
[unit]
[point=point,
basepoint=basepoint,
scaledpoint=scaledpoint,
didot=didot,
cicero=cicero]

```

Possible categories are: `prefix`, `unit`, `operator`, `suffix`, `symbol`, `packaged`. Next we define labels:

```

\setupunittext
[point=pt,
basepoint=bp,
scaledpoint=sp,
didot=dd,
cicero=cc]

```

Now we can use use these:

```
\unit{10 point / second}
```

Of course you can wonder what this means.

10 pt/s

When no label is defined the long name is used:

```
\registerunit
  [unit]
  [page=page]
```

This is used as:

```
\unit{10 point / page}
```

Which gives:

10 pt/page

7 Built in keywords

A given sequence of keywords is translated in an list of internal keywords. For instance `m`, `Meter` and `meter` all become `meter` and that one is used when resolving a label. In the next tables the right column mentions the internal keyword. The right column shows the Cased variant, but a lowercase one is built-in as well.

The following prefixes are built-in:

units:operators		
OutOf	outof	:
Per	per	/
Solidus	solidus	/
